- 1. The virtual interface device performs matching operation for the data frames according to classifying rules
- 2. The virtual interface device modifies the data frames according to classifying rules
- 3. The virtual interface device transfers the data frames to the data processing and dispatching device
- 4. The data processing and dispatching device finds corresponding processing unit according to the data type number in the data frames

- 6. The processing device processes the data frames and transfers them to the data processing and dispatching device
- 8. The virtual interface device finds the corresponding device interface according to the data type number in the data frames
- 9. The virtual interface device modifies the data frames, i.e., deletes the data type number from the data frames
- 10. The virtual interface device outputs the data frames via the device interface
